

Abstract

The main idea for this project was to implement and design software that helps users searching books in the library. The project includes implementing software that enables the users to search in easy way, borrow and return books, and enable the Librarian to add and delete books. The system should check the books if them in the store, and should give messages if the user enters wrong inputs or the system doesn't found the books in the store.

The program was implemented and completed successfully as planned and required using C++ programming language on Linux and results were obtained.
